

Global Airbnb Performance Dashboard Report

This project analyzes Airbnb listing performance, customer trust, pricing strategy, ratings, and review behavior across major global cities using Power BI dashboarding and business analytics. The goal of this project is to uncover actionable insights that can help improve platform engagement, host trust, customer experience, and strategic growth decisions.

Project Highlights

- 279,712 Listings analyzed across 10 cities
- 182,024 Hosts included in the analysis
- 5.3M+ Customer reviews studied
- 144 Property types evaluated
- Dashboard built using Power BI

Growth & Listing Trends

The dashboard shows strong Airbnb expansion between 2010 and 2015, with peak growth reached during 2015. Listing growth slowed after local market restrictions increased, and the COVID-19 pandemic caused a significant decline after 2019. This insight explains how external market conditions directly affect platform scale and listing availability.

Market Share & Ratings Insights

Paris, New York City, and Sydney contribute nearly half of total listings and customer reviews, making them the strongest-performing Airbnb markets. Entire-home properties command the highest pricing, showing that customers are willing to pay premium prices for privacy and complete accommodation experiences. Mexico City and Rio de Janeiro achieved the strongest customer ratings across cleanliness, communication, and overall experience metrics.

Customer Trust & Review Behavior

Nearly 99% of users posted three reviews or fewer, showing highly skewed customer participation. A very small number of users generated unusually high review activity, indicating potential power users or highly engaged travelers. The trust analysis revealed that most hosts are fully verified, while anonymous and unverified profiles form only a very small percentage of the ecosystem. This demonstrates strong trust and platform reliability.

Key Business Insights

- Paris dominates Airbnb market share and customer engagement.
- Entire-home listings generate the highest pricing advantage.
- Verified hosts improve customer confidence and platform trust.
- Customer satisfaction ratings remain strong across major cities.
- Seasonal review activity varies across regions and travel periods.
- COVID-19 significantly impacted listing growth and platform activity.

Business Recommendations

- Expand host verification initiatives to strengthen customer trust.
- Focus marketing campaigns on high-performing cities.
- Improve cleanliness and value-focused customer experiences.
- Develop retention strategies for repeat travelers and active reviewers.
- Optimize pricing strategies for premium property categories.
- Monitor post-pandemic recovery trends to guide expansion planning.

Final Analysis Notes

Through this analysis, I observed how Airbnb's performance varies significantly across cities, customer behavior patterns, and property categories. The dashboard helped me understand how market concentration, pricing strategy, customer trust, and seasonal trends influence platform growth. One of the most interesting findings was that a small percentage of users generated a large share of reviews, while verified hosts played a major role in maintaining customer trust. I also noticed that premium property types such as entire homes consistently achieved stronger pricing performance. Overall, this project improved my understanding of business intelligence, dashboard storytelling, and how data visualization can support strategic business decision-making.
